* NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces
* is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Homo sapiens DNA sequence from clone 501N12 on chromosome 6p21.1-23 Contains a gene almost identical to four genes of unknown function, a pseudogene, three (pseudo?) genes similar to genes of unknown function, an unknown gene similar to a rat EST, a PX19 LIKE pseudogene and another unknown gene. Contains ESTs, STSS
                                                                                                                                                                                                                                                                                                                                                  Wu, H., Yao, Z., McDermid, H. and Roe, B.A.

* NOTE: This is a "working draft" sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Clone requests: clonerequect(sanger.ac.uk

On Jul 1, 1998 this sequence version replaced gi:2980811.

During sequence assembly data is comparated from overlapping clones.

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence is the entire insert of clone 501M12. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key.

This sequence was generated from part of bacterial clone contigs of human chromosome 6, mapping group and Armin Volz & Andreas Ziegler. Further information can be found at humin chromosome 6 mapping group and Armin Volz & Andreas Ziegler. Further information can be found at humin chromosome 6 mapping group and Armin Volz & Andreas Ziegler. Further information can be found at humin chromosome 6 mapping group and Armin Volz & Andreas Ziegler. Further information can be found at humin chromosome formed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.mac.ubd.biffalo.edu/ VECTOR: pCYPAC2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      join(<6829. ..6895,15857. .15985,17949. .18080,28912. .29087, 32011. .32098.34703. .>34852)

On Jul 31, 1998 this Sequence version replaced gi:2909600.
Sequencing is completed to a minimum standard of double strand
coverage with a minimum of 2 clones and 2 reads with no ambiguities
or 2 chemistries with a minimum of 2 clones and 3 reads with no
ambiguities. If the sequence quality does not meet this standard,
it will be indicated in the annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Exon/Intron boundaries of identified genes were chosen if there were canonical splice junctions that maintained sequence continuity across the splice junctions.
                                                                                                                                                                                                                                                                                                                                                                                                   Direct Submission

IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments. Unfinished: dJ856G1 Contig_ID: 01260 acc-AL033381 Length: 151795 bp.

* NOTE: This is a 'working draft' sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22-JUN-1999 (first entry)
Human IL-1ra BAC contiguous DNA sequence 33.
Tango-77: human: IL-1ra: cytokine superfamily; inflammation; inhibition; interleukin-1 receptor; IL-1R; requiation; asthma: rheumatori arthritis; chronic myelogenous leukaemla; psoriasis; inflammatory bowel disease; growth factors; treatment; IL-1 receptor complex; BAC; ss.
                                                                                                                Transcriptor of patient's genetic polymorphism pattern - allows reduction of increased periodontal disease severity claim 3: Page 25; 33pp; English.

Claim 3: Page 25; 33pp; English.

Claim 3: Page 25; 33pp; English.

Cor identifying a genetic predisposition to periodontal disease by detecting the presence of DNA polymorphisms in the gene sequences for interleukin-1 alpha (IL-1A) and interleukin-1 beta (IL-1B).

Alleles associated with severe disease were identified as IL-1B, alleles a sociated with severe disease were identified as IL-1B, alleles 2 together with IL-1B (Tag1) allele 2. The primers are used to amplify DNA from a blood or tissue sample and products are subjected to restriction digestion to determine the polymorphism pattern. A single base variation (C/T) polymorphism at IL-1A base -889 can be identified using primers (T70316 and respectively. An Nocl site is created if C is available at -889, but not if T is present.

Mew method of determining a patient's susceptibility to inflammatory disorders - by detecting the presence of an IL-1 (4411232)

The protection of designing treatment strategies that modulate the activity of proteins produced by the IL-1 gene cluster

The activity of proteins produced by the IL-1 gene cluster

Claim 3: Page 33: 49pp; English.

C A method has been developed for determining a patient's susceptibility to an inflammatory disorder. The method comprises the detection of an interference its presence indicates susceptibility to an inflammatory disorder. Al667 to X16631 represent PCR primer used in the method for detecting the IL-1 (44112332) haplotype. The method provides kits for detecting the IL-1 (44112332) haplotype. The method provides kits for the early prediction of a patient's susceptibility to an inflammatory corpusty artery disease, osteoporosis, nephropathy alsorders, including coronary artery disease, osteoporosis, nephropathy in diabetes mellitus, alopecia areata, Graves disease, systemic lupus cervithmancous. Inchem sclerosis and utcerative colitis. The detection of alsorders, including diabetic retinopathy, juvenile chronic arthritis, alopecia areata disease, osteoporosis, nephropathy coronarising diabetic retinopathy, juvenile chronic arthritis, protections of disease-associated haplotype enables determination of which alleles are constrained the activity of proteins produced by the IL-1 gene cluster. Some alleles from the IL-1 gene cluster are associated with particular inflammatory diseases, and insufficient IL-1 production appears to act centrally in the pathology of these diseases. Therefore, the use of IL-1 gene clusters is useful in determining genetic susceptibility to act gene clusters is useful in determining genetic susceptibility to act conformatory diseases, including those with a multifactorial etiology with a polygenic component.
                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents one of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for including cellulities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ő
                                                                                                                                                                                                                                                                                                                                                                                          Polynicleotide(s) and proteins derived from Staphylococcus aureus stored on computer readable medium and used in the production of anti-S.aureus vaccines.
Claim 1, Page 2938, 3271pp; English.
This sequence represents one of 5191 Staphylococcus aureus DNA sequences

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (RAM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating computer readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

Claim 7: Page 11-12: 16pp; Japanese.

The present sequence encodes nitrile hydratase subunit beta, a novel protein isolated from Bacillus smithii. The protein has hydration activity for converting acrylonitrile into acryloamide. It is useful for producing amide from nitrile by biological catalysis.

New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis (Z1aim 1: Page 593-597; 1150pp; English.

X20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detection diseases related to Borrella infections in animals, and for the production of biosynthetic products such as enzymes.

Treponema pallidum.
                                                                                                                                                                                   Prodn. of interferon in yeast - by use of recombinant DNA segment contg. suc 2 promoter linked to interferon gene Example: Page 48: 53pp; English.

The inventors claim a managed for the prodn. of interferon in yeast by use of recombinant DNA segment contg. suc 2 promoter linked to interferon gene. The interferon synthesis can be regulated over a broad rangee by changes in the culture medium, e.g. synthesis is depleted. Also claimed is yeast strain ATCC 20644-CGY144.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 anti-S. aureus vaccines

Claim 1: Page 2639-2640; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (RAM) or DO-RAM. Homology searches using that sureus DNA sequences allows putative functions to be assigned to that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. aureus infection. The polypeptides can also be used in a Nit for the immunodetection of the polypeptides can also be used in a Nit for the immunodetection of the contract of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

12982 nucleotide sequences isolated from the Enterococcus faecalis genome.
12038 to Mi3919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcus infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Polynucleotide(s) and proteins derived from Staphylococcus aureus - stored on computer readable medium and used in the production of a natis: Aureus vaccines

Tain 1: Page 3132; 3271pp; English.

Claim 1: Page 3132; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences

CC the invention. The DNA sequences are recorded on a computer readable

medium, preferably selected from a floppy or hard disk, random access

CC medium, preferably selected from a floppy or hard disk, random access

CC that protein-enroding or requilatory ROWI or CD-ROW. Homology searches using

the S.aureus DNA sequences allows puttive functions to be assigned so

that protein-encoding or regulatory regions of commercial, therapeutic or

industrial importance can be obtained. Specifically, sequences which are

likely to encode antigens have been identified and these polypeptides can

be used in a vaccine composition against S.aureus infection. The

polypeptides can also be used in a kit for the immunodetection of

S.aureus in a sample. S.aureus is implicated in numerous human diseases,

including cellulitis, eyelid infections, food poisoning, osteomyelitis,

syndrome, etc. Organisms transformed with the DNA sequences can be used

for recombinant production of the polypeptides. The new DNA sequences

content readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of this sequence represents one of 5191 Staphylococcus aureus DNA sequences of the Invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access compared from a floppy or hard disk, random access compared from a floppy or hard disk, random access compared from a floppy or hard disk, random access compared from a floppy or hard disk, random access compared from a flop protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition adainst S aureus infection. The polypeptides can also be used in a kit for the immunodetection of saureus in a sample. S aureus is fimplicated in numerous human diseases, including cellulitis, eyelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences core contained on the constant of the saureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

/note="Organ: Kidney; Vector: p1713D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI: Plasmid DNA from the normalized library NCI_CGAP_Kid3 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive Hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (clonelDs 132376-1323911, 1456007-1456775, and Patima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AV046966 226 bp mRNA EST 18-MAY-1999
